Timothy Glomb, DMD, PA

## Sealants

Today most cavities occur on the biting surface of the back teeth. Dental sealants provide specific protection against that kind of cavity. A dental sealant is a clear or shaded plastic material that is painted directly into the grooves on the biting surface of the back teeth. Sealants significantly reduce decay, but are not a substitute for good diet and oral hygiene.

To prolong the life of the sealants, please **DO NOT CHEW ICE OR HARD CANDY.**
