

## Stainless Steel Crowns

Stainless steel crowns are silver colored, prefabricated crowns used to restore mainly primary teeth. They are a long term temporary restoration. For our purposes they are permanent. They are used when:

- 1) Considerable tooth structure is lost to decay
- 2) A large filling would be prone to breakage
- 3) A restoration after a pulpotomy is required

To prevent damage to stainless steel crowns, please **DO NOT CHEW BUBBLE GUM, STICKY CANDY, OR FRUIT ROLL UPS.**
